

HITACHI

NP6C/NP6C-2 Chassis Models CRP-143, CTP-203 CTP-213, CWP-132

CAUTION:

Before servicing this chassis, it is important that the service technician read the "Safety Precaution" and "Product Safety Notices" in this Service Manual.

SOLID STATE COLOUR TELEVISION

March 1977

SAFETY PRECAUTIONS

WARNING : Since the chassis of this receiver is connected to one side of the Mains Supply during operation, service should not be attempted by anyone unfamiliar with the precautions necessary when working on this type of equipment. The following precautions should be observed.

1. Do not install, remove, or handle the picture tube in any manner unless shatter-proof goggles are worn. People not so equipped should be kept away while picture tubes are handled. Keep picture tube away from the body while handling.
2. When service is required, an isolation transformer should be inserted between power line and the receiver before any service is performed on a "HOT" chassis receiver.
3. When replacing a chassis in the cabinet, always replace all the protective devices are put back in place, such as; barriers, non-metallic knobs, adjustment and compartment cover or shields, isolation resistor-capacitor, etc.
4. When service is required, observe the original lead dress. Extra precaution should be taken to assure correct lead dress in the high voltage circuitry area.
5. Always use the manufacturer's replacement component. Especially critical components as indicated on the circuit diagram should not be replaced by other makes. Furthermore where a short circuit has occurred, replace those components that indicate evidence of overheating.
6. Before returning a serviced receiver to the customer, the service technician must thoroughly test the unit to be certain that it is completely safe to operate without danger of electrical shock, and be sure that no protective device built into the instrument by the manufacturer has become defective, or inadvertently defeated during servicing.

Therefore, the following checks are recommended for the continued protection of the customers and service technicians.

INSULATION

Insulation resistance should not be less than $7M\Omega$ at 500V DC between the mains poles and any accessible metal parts.

Also, No flashover or breakdown should occur during the dielectric strength test, to apply 4KV AC for one minute between the mains poles and any accessible metal parts.

HIGH VOLTAGE

High voltage should always be kept at rated value of the chassis, no higher. Operating at higher voltage may cause a failure of the picture tube or high voltage supply and, also, under certain circumstances could produce X-radiation moderately in excess of design levels. The high voltage must not, under any circumstances, exceed 25KV on the chassis.

X- RADIATION

TUBES: The primary source of X radiation in this receiver is the picture tube. The tube utilized for the above mentioned function in this chassis is specially constructed to limit X radiation emissions.

For continued X radiation protection, the replacement tube must be the same type as the original, HITACHI approved type.

PRODUCT SAFETY NOTICE

Many electrical and mechanical parts in HITACHI television receiver have special safety related characteristics. These characteristics are often not evident from visual inspection nor can the protection afforded by them necessarily be obtained by using replacement components rated for higher voltage, wattage, etc. Replacement parts which have these special safety characteristics are identified in this Service Manual.

Electrical components having such features are identified by marking with a Δ on the schematics and on the parts the parts list in this Service Manual.

The use of a substitute replacement component which does not have the same safety characteristics as the HITACHI recommended replacement one, shown in the parts list in this Service Manual, may create shock, fire, X radiation, or other hazards.

Product Safety is continuously under review and new instructions are issued from time to time. For the latest information, always consult the current HITACHI Service Manual. A subscription to, or additional copies of, HITACHI Service Manual may be obtained at a nominal charge from your HITACHI SALES CORPORATION.

CONFIGURATION OF CHASSIS

NP6C chassis consists of two principle circuit units, i.e. the signal unit and the power supply & deflection unit. The construction of this television receiver is described on a chart as below.

A major part of the units and boards are connected through plug-in system and no solder iron is needed on disassembling.

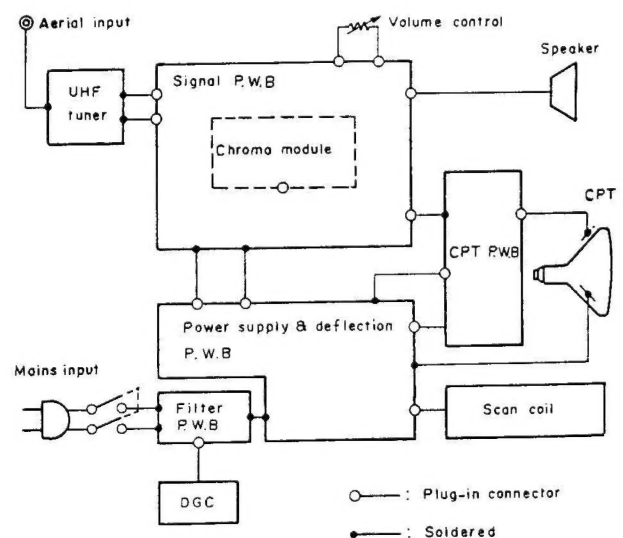

Fig. 1

TECHNICAL PRECAUTIONS

1. Power supply circuit (HT1 stabilizing circuit)

a) Circuit function

Power supply circuit incorporated in NP6C chassis is a switching mode stabilized power supply, and its block diagram is shown in Fig. 2.

Mains input is rectified and this unstabilized DC voltage is switched by the line frequency synchronized switching signal.

The duration of the switched square wave is altered and this switched square wave is rectified, hence stabilized HT1 output is obtained.

When switching on the receiver, the switching signal is derived from the oscillator and after starting on, the shaped pulse from the line output stage is fed to the pulse width modulator.

Output (HT1) is compared with the reference voltage and the amount of error detected, being fed to pulse

width modulator, alter the duty ratio of switching signal and stabilize HT 1.

Two thick film module incorporated are for setting of HT 1 and HV (EHT) limit circuit and no adjustment is necessary.

b) Replacement

If the replacement of any component listed below is necessary, no spare parts should be replaced but those approved and appointed by HITACHI.

Component	Circuit No.
Voltage setting module	CP 901
Error amp. Transistor	TR 907
Resistor	R 928

After the replacement has been carried out, be sure to check and see that HT 1 output is within $110.0 \pm 3V$.

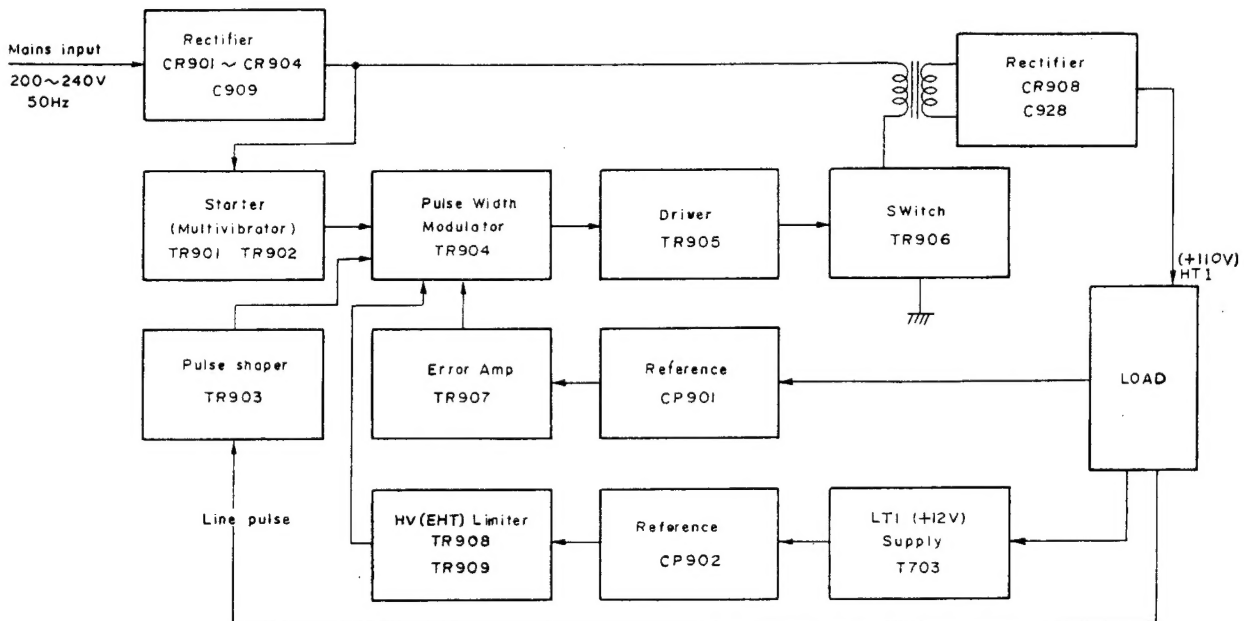

Fig. 2

c) Voltage setting module

The chassis incorporates newly developed thick film voltage setting modules.

These are for HT 1 voltage setting and HV (EHT) limiting. The module includes two functions, voltage divider and reference voltage stage as shown in Fig. 3 (b).

Fig. 3 (a) shows a conventional error detector.

HT 1 output is divided by the resistors R1 and R2, and compared with the reference voltage produced by CR1. The amount of error is amplified and fed back to stabilize the HT 1.

A conventional type has a potentiometer R2, which absorbs the component's tolerances as of resistor R1 etc.,

and alter the dividing ratio, therefore stabilized HT 1 is derived.

Fig. 3 (b) shows a error detector with the voltage setting module incorporated.

HT 1 is applied to the voltage divider (between terminal 1 and 5) and divided voltage is derived at terminal ③. Between terminal ② and ④, the reference voltage is produced. The amount of error is amplified and fed back to stabilize HT 1.

The voltage divider, whose resistors are printed and trimmed, is preadjusted and fixed to obtain nominal HT 1 value. Therefore no adjustment procedure is necessary.

c) Operation Checking

Check the operation of the HV (EHT) limit circuit as described below, after the replacement is carried out.

- 1) Connect between TP-912 and TP-913 with a short link. – Fig. 4
- 2) See that the HV (EHT) limit circuit operates and HV (EHT) is ceased.
- 3) Turn off the mains switch and disconnect the short link.
- 4) See that the receiver operates normally when the set is turned on again.

3. Line oscillator circuit

Line oscillator coil (H. Hold coil-T701) is fixed with glue at the factory to prevent the H. Hold coil from being maladjusted for lower frequency resulting abnormal EHT in the receiver.

Therefore when you service the receiver, don't try to adjust or break the fixed H. Hold coil.

Please observe the following procedure when the adjustment of H. Hold is necessary.

The adjustment is required when any of the following parts have been replaced.

TR702 R715 R716 R717 R718 R721,
R758 C710, C709

Adjustment procedure

- Step. 1; Replace the fixed H. Hold Coil (T701) with new one.
- Step. 2; Turn the core of H. Hold Coil fully counter-clockwise.
- Step. 3; Turn the receiver "ON".
- Step. 4; Defeat the line synchronization by grounding the B2 terminal with a capacitor 10 μ F/50V.
- Step. 5; Obtain line synchronization by turning the core of H. Hold Coil (T701) clockwise.
- Step. 6; Turn the receiver "OFF".
- Step. 7; Release the capacitor connected at Step. 4.
- Step. 8; Fix the H. Hold Coil with glue as shown below.

Parts name	Type No.	Parts No.	Remarks
glue	Polyamide hot melt adhesive Tru-Line No. 3 or Epoxy resin cemedine No. 1500	9485256 2784011	used at factory
glue	Epoxy resin cemedine No. 1500	2784011	used for servicing

Setp. 9; Confirm that the HV (EHT) limit circuit works correctly.

(Refer to the checking method in 2. c))

CONTROLS

11. AERIAL INPUT
12. CHANNEL POINTERS
13. CHANNEL TUNING KNOBS

TECHNICAL FEATURES

1. **NEW STABILIZED POWER SUPPLY CIRCUIT (HT 1).**
HT 1 stabilizing circuit serves for stabilizing HT 1 output against supply mains fluctuations and/or load variations. In NP6C chassis, A newly developed switched mode power supply circuit is adopted.
 - (a) Fully secured against short circuit.
 - (b) Automatic shut off against faulty conditions in the line scan circuit, power supply circuit and EHT circuit.
 - (c) No adjustment for HT 1 output is necessary.
 - (d) No voltage setting against the difference of main supply voltage i.e. 240V is necessary.
 - (e) Low power consumption - - 75W.
2. **NEW COLOUR PICTURE TUBE.**
New HITACHI inline picture tube has been developed with high precision technology and skill.
 - (a) Convergence-free tube system with newly developed saddle-toroidal type scan coil.
 - (b) 76 deflection angle enables flat picture tube face.
 - (c) Sharp and crisp picture with the precision gun and the large electron lenses.
3. **NEW DIODE SPLIT TYPE LOPT.**
Newly developed diode split type LOPT is a combination of LOPT and tripler. It realizes higher efficiency and better reliability.
4. **NEW IC.**
Newly developed one-chip monolithic chroma processing IC with automatic colour contrast control function realizes enhanced colour performance.
5. **IC/TRANSISTORIZED CIRCUITS**
With the long experience of solid state technology and the developments of colour television skill, HITACHI colour television incorporates IC, transistor circuits for stable quality, less power consumption, and high reliability.
6. **QUICK START.**
Quick start colour picture tube provides "Quick Start" feature without preheating method.
After switching on the set, the picture comes out in around five seconds.
7. **HIGH RELIABILITY AND SAFETY.**
Highly printed circuits, stabilized power supply, and various protection circuits assure highly reliable receiver performance. Adjustment-free aspect on stabilized high tension and excessive EHT limit circuit assure highly safe operation.
8. **HIGH SERVICEABILITY.**
NP6C chassis consist of only two units and all components, including LOPT and power supplying circuit, are on the two units. Since this system reduced the numbers of the flying leads and connectors, better accessibility and easier diagnosis are realized.

DISASSEMBLY

1. How to remove the Power supp./DEF chassis.
 - 1) Pull the chassis straight back as in Figure.

Pull the chassis straight back

3. How to remove the programm unit.
 - 1) To remove the programm unit, loosen two screws (No. ②).

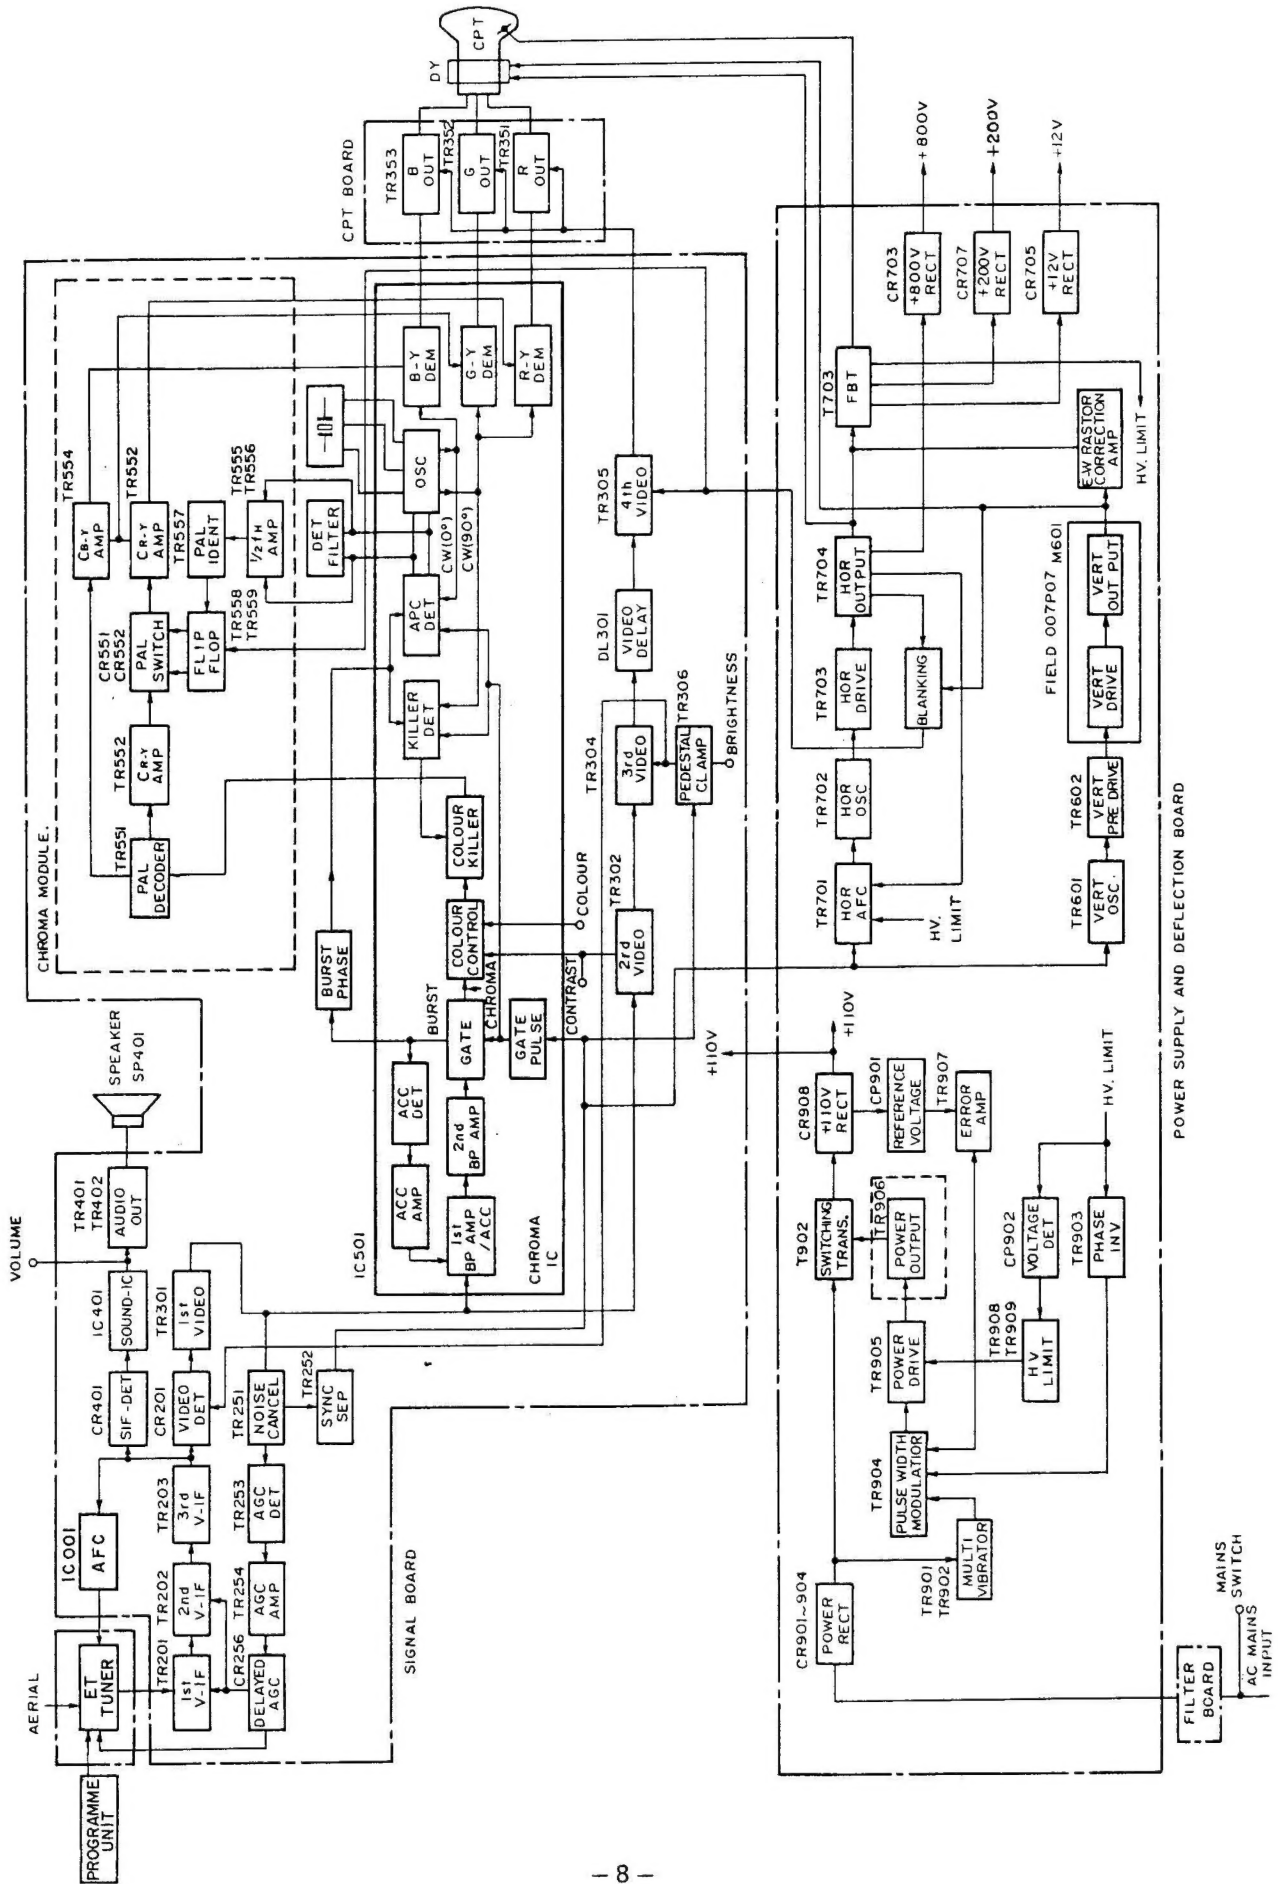

2. How to remove the chroma module.
 - 1) Releasing 1 plastic holder ①.

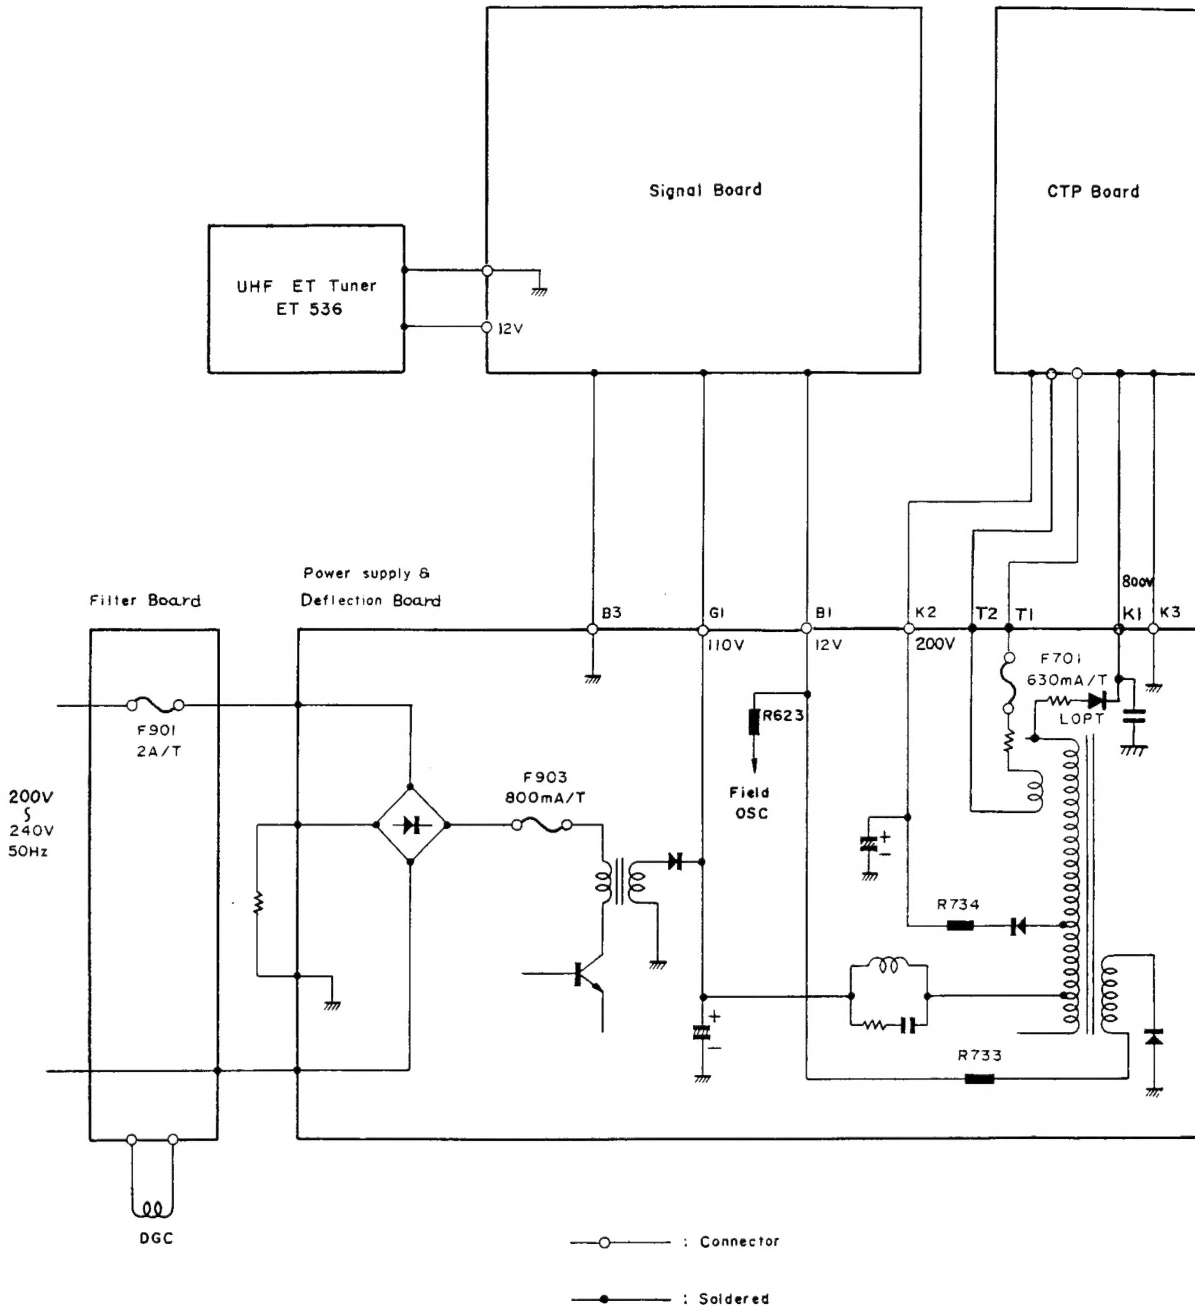

4. How to remove the speaker, control block.
 - 1) To remove the speaker, loosen four screws (No. ③).
 - 2) To remove the control block, loosen two screws (No. ④).

BLOCK DIAGRAM

VOLTAGE SUPPLY DIAGRAM

CONNECTION FOR ALIENMNT

Fig. 5

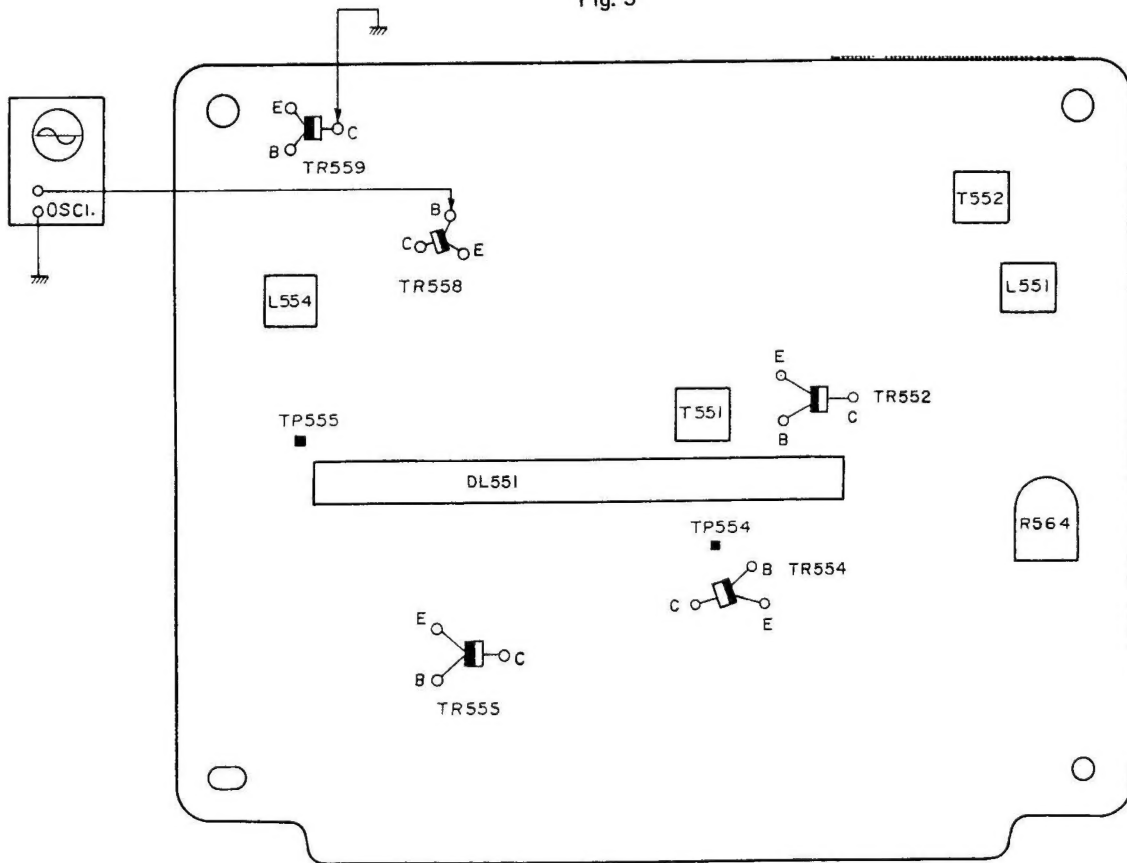

Fig. 6

PRIMARY ALIGNMENT

1. V-IF ALIGNMENT Fig. 5, 6.

- Step 1) Supply +3.2V to TP253.
- Step 2) Supply +3.2V to TP253, and +5.6V to AGC terminal for the tuner;
- Step 3) Signal generator connect to collector of TR202 through 1000pF capacitor.

Step	Signal Generator	Oscilloscope	Alignment Circuit	Alignemnt	Result	Response
1	Collector TR 202	TP 301 (Emitter TR 301)	Rejector	L 206	33.5 MHz – min .	
				T 203	Response as right	
				T 204	Response as right	
2	Tuner TP Wobbler Marker	TP 401	Rejector	CP 201	41.5 MHz – min.	
			Rejector	CP 202	31.5 MHz – min.	
			Rejector	CP 203	33.5 MHz – min.	
			CP 204	Response as right		
	TP 301 (Emitter TR 301)					

2. CHROMINANCE BANDPASS AMP. ALIGNMENT Fig. 5, 6.

- (a) Supply + 3.2V to TP253 V-IF AGC.
- (b) Connect a signal generator (Wobbler with marker and V-IF generator) to the TP-tuner.
- (c) Connect an oscilloscope the primary end of T501
- (d) Align L501 and T501 so as to obtain the response as below.

Fig. 7

note) Method of signal generator connecting for above alignment.

Fig. 8

3. Colour alignment Fig. 6.

3.1 Primary alignment

Step	Alignment	Oscilloscope	Aligning	Result	Note	Oscillogram
1	Reference oscillator		R 525	Obtain colour synchronization.	Supply +12V to TP 503 Ground TP 505 through a resistor 22kΩ.	
2	PAL identification	Base - TR 558	L 554	Response as right	Ground the collector of TR 559. This step should be carried out after Line frequency alignment.	
3	PAL decoder	Connector - (R - Y)	R 564 L 551 respectively	min. amplitude	only with colour-bar generator - "PAL OFF"	Refer to the next page on alignment with the electronic test card.
4	0° phase	Connector - (B - Y)	R 544	Adjust the time axis of the oscilloscope to obtain the super imposition of two lines.	Connect between both bases of TR 552 and TR 554.	
5	90° phase	Connector - (R - Y)	T 552	min. difference of succeeding lines.		

3.2 Alignment with the electronic test card . . . Fig. 9.

Step	Alignment	Aligning	Result
1	PAL decoder	L 551	min. Hannover line on part cyan
		R 564	min. Hannover line on part $+(R-Y), \pm (B-Y)$
2	0° phase	R 544	Part $+(R-Y)$ colourless
3	90° phase	T 552	Part $\pm (B-Y)$ colourless

Fig. 9

4. S-IF ALIGNMENT

- (a) Connect a AM Signal Generator to TP 401 as follow. Fig. 10.

Fig. 10

- (b) Connect an osilloscope to terminal F1.
 (c) Set the AM Signal Generator as follow.
 Carrier frequency : 6.0 MHz
 Modulation : 400 Hz, 30%
 Output : -75dBm to -55dBm
 ($34\text{dB}\mu$) ($54\text{dB}\mu$)
 (d) Align L405 to obtain minimum signal.

5. AGC DELAY ALIGNMENT.

- (a) Adjust the input RF level to -56dBm .
 ($53\text{dB}\mu$)
 (b) Sock (warm up) the set at least 2 minutes.
 (c) Connect a DC-Voltmeter to the both ends of CR 256.
 (d) Align R265 so that the meter reads $0 \pm 0.1\text{V}$.

6. ALIGNMENT WITH BLACK AND WHITE PICTURE. . . Fig. 11.

- 6.1 Horizontal (Line) frequency;
 Set the R713 at the middle point. Ground the B2 terminal (on the signal board.) through a capacitor $10\mu\text{F}/50\text{V}$ and align T701 so as to obtain the correct line frequency. (See Technical PRECAUTIONS 3.)
 6.2 Picture width;
 Connect the H. SIZE link to either S,M, or L to obtain the correct picture width.
 6.3 Horizontal centering;
 Connect the H. CENT. link to either R or L to obtain the correct horizontal centering.
 6.4 Sub H. HOLD ;
 If the horizontal picture phase is shifted, adjust R713 . .
 6.5 E-W correction (Side pincushion)
 Adjust R750 so as to obtain the minimum side pincushion distortion.
 6.6 Vertical (Field) frequency ;
 Connect TP 601 with TP 603 by a resistor $15\text{k}\Omega$.
 Adjust R605 so as to obtain the correct field frequency.
 Note
 This step should be checked again after carrying out steps 6.7, 6.8, 6.9.
 6.7 Picture height :
 Adjust R 607 so as to obtain the correct picture height.
 6.8 Vertical centering ;
 Adjust R 622 so as to obtain the correct vertical centre.
 6.9 Vertical linearity ;
 Adjust R 609.
 6.10 Focus;
 Adjust R 740.

Fig. 11
 - 14 -

7. GREY SCALE TRACKING. Fig. 12.

The receiver should be soaked (warm up) at least 10 minutes before carrying out the adjustments.

Set the tint control at its middle position.

- (a) Receive a white raster test card and set the Drive controls (R 857 & R 863) at their middle positions.
- (b) Turn the Back Ground Level (BGL) controls (R 865, R 859 & R 853) fully counterclockwise. (The picture will be darkened.)
- (c) Turn the Screen control (R 872) fully counterclockwise.
- (d) Set the Contrast control at its minimum.
- (e) Disconnect the Y-connector from the signal board and connect TP 602 with TP 603 with a short link. (Field oscillator defeats.)
- (f) Turn up the Screen control (R872) gradually until one of three coloured lines faintly appears on the screen. (e.g. blue)
Unless any coloured line comes out, turn the Screen control fully clockwise, then adjust the Blue-, Red- and Green-BGL controls so that three coloured lines equally appears on the screen.
- (g) Keep one of the BGL-controls which corresponds to above colour (e.g. Blue-BGL R 865) at it is, and turn up other two controls (e.g. R 853, and R 859) until their coloured lines also faintly appear on the screen.
- (h) Disconnect the short link from TP 602 and TP 603 (Field oscillator operates.), and connect the Y-connector to the signal board.
- (i) Turn the Contrast control fully counterclockwise and turn the Brightness control fully counterclockwise. Set the Sub-brightness control (R 327) so that the white raster faintly appears on the screen.
- (j) Adjust those two BGL-controls (e.g. R 853 and R 859) so that the correct grey scale tracking at low brightness is obtained.
- (k) Turn up the Contrast control and adjust the Drive controls (R 857 and R 863) so that the correct grey scale tracking at high brightness is obtained.
- (l) Turn down the Contrast control and check the correct grey scale tracking at low brightness. Otherwise readjust those two BGL-controls (e.g. R 853 and R 859) for the correct grey scale tracking.
- (m) Repeat steps (k) and (l) several times, until the ideal grey scale tracking is obtained under whole brightness range.

Fig. 12

8. SUB BRIGHTNESS ALIGNMENT.Fig. 13

- (a) Set the Brightness control at its middle position and the contrast control at its minimum.
- (b) Release the field locking by V. hold control (R605) and let the blanking aprt appear on the screen and stand still as possible as you can.
- (c) Observe the black level of part A, and turn up the Sub brightness control (R 327) gradually until that level can be noticed to turn grey.

Fig. 13

9. CONVERGENCE ALIGNMENT.Fig. 14

1) NP6C chassis television receiver incorporates new colour picture tube system, i.e. HITACHI. flat face inline type tube, saddle-troidal scan coil and convergence-free features.

Since the convergence quality is strictly controlled in the factory and to be secured its performance after installation, the reconvergence is not normally required.

When it is needed in case of the replacement of a picture tube or a scan coil etc., please read and follow the the adjustment procedure step by step to obtain the best results, because this is rather different from the conventional tube system.

- 2) Set the television receiver facing to the south, and soak it at least 10 mins.
Check the horizontal and vertical linearity, the picture width, and the focus as already described on the previous pages.
Receive a cross-hatch test card.
- 3) In case of the replacement fo the picture tube, wind the adhesive tape (bandage type is preferable) around the neck, for securing purpose of scan coil.

Fig. 14

10. PURITY ALIGNMENT Fig. 15, 16. 17

As before proceeding the below, please undergo preliminary static convergence adjustment on this page.

- 1) Push the scan coil fully up to funnel part of the picture tube. Disconnect the (G-Y) plug from the signal board and see the broad mazenata belt appears on the screen . . . Fig. 15 (a).
- 2) Pull out the scan coil gradually towards you and see that two oval parts (coloured pale yellow and light blue) appear on each side of the screen . . . Fig. 15 (b).
- 3) Rotate the purity magnet (c) (Fig. 16), and set two coloured parts to become equal in area. . . Fig. 15(c).
- 4) Insert preliminary rubber wedge between the funnel and the scan coil at the top position, and tilt the scan coil backward at the top.
- 5) Pull out the scan coil gradually towards you again until two coloured parts disappear simultaneously. See that the white purity (connect (G-Y) plug) is all right, if not, pull out the scan coil until ideal white purity is obtained. Fasten the scan coil securely by tightening the screw
- 6) Unless the red purity (disconnect both (G-Y), (B-Y) plugs) is obtained, repeat the steps 2) ~ 5) again.

Note) Put the purity-convergence magnet assembly on the picture tube neck, so that the edge of tightning ring isolated 32 mm from the tip of the neck. . . Fig. 16.
Secure it firmly by tightning the screw.

(a)

(b)

(c)

Fig. 15

11. STATIC CONVERGENCE ALIGNMENT. . . . Fig. 16 and Fig. 17.

This procedure is the convergence alignment for the centre part of the screen.

Step	Convergence lines	Magnet (Fig. 16)	Movement (Fig. 17)	Centre of the screen
1	Vertical Blue and Red	4 poles (A)	sliding (a)	
2	Horizontal Blue and Red	4 poles (A)	rotating (b)	
3	Vertical B/R and Green	6 poles (B)	sliding (a)	
4	Horizontal B/R and Green	6 poles (B)	rotating (b)	
5	Repeat steps 1) through 4).			
6	If the correct convergence is not obtainable after carrying out the steps 1) through 5) above, displace the purity-convergence magnet assembly along the neck of the picture tube within the range of ± 5 mm and repeat steps 1) through 5).			

Fig. 16

Fig. 17

12. DYNAMIC CONVERGENCE ALIGNMENT

This procedure is the convergence alignment for the circumference of the screen.

- 1) Push in the preliminary rubber wedge between the funnel part and scan coil gradually until both horizontal and vertical lines are converged at the circumference of the screen. . . Fig. 18.

Fig. 18

- 2) Proceed the either case according to the arrangements on the screen. . . Fig. 19 (a) and (b).

CASE (a)

(a)

CASE (b)

(b)

Fig. 19

CASE (a)

- i) Insert fixing wedge at 9 o'clock position, until three coloured squares are converged.
- ii) Insert two fixing wedges at 1 and 5 o'clock positions and fix three wedges by highly adhesive tape. Then pull up preliminary wedge.

(a)

Fig. 20

CASE (b)

- i) Insert fixing wedge at 3 o'clock position, until three coloured squares are converged.
- ii) Insert two fixing wedges at 7 and 11 o'clock positions and fix three wedges by highly adhesive tape. Then pull up the preliminary wedge.

Components marked with a Δ components, read carefully the improper servicing.

PRODUCT SAFETY NOTE

Components marked with a Δ and shaded have special characteristics important to safety. Before replacing any of these components, read carefully the "Product safety notices" of this service manual. Don't degrade the safety of the receiver through improper servicing.

IMPORTANT

The component shaded in red is sealed at the factory. No attempt shall be made to adjust or defeat T701. Refer to Page 5 in Service Manual when it is necessary to adjust the sealed component during servicing.

- Since this is a basic circuit diagram, the value of the parts is subject to be altered for improvement.
 - All DC voltage to be measured with a tester (100K Ω /V).
- Voltages taken on a complex colour bar signal including a standard colour bar signal.

- Since this is a basic circuit diagram, the value of the parts is subject to be altered for improvement.
- All DC voltage to be measured with a tester (100K Ω /V). Voltages taken on a complex colour bar signal including a standard colour bar signal.
- All resistors are in ohms. K=1,000 M=1,000K
- All capacitors are in μ F, unless otherwise noted. P= μ M
-  indicates a fuse resistor.

PRODUCT SAFETY NOTE

Components marked with a Δ and shaded have special characteristics important to safety. Before replacing any of these components read carefully the product safety notice of this service manual. Don't degrade the safety of the receiver through improper servicing.

IMPORTANT

The component shaded in red is sealed at the factory.
No attempt shall be made to adjust or defeat T701.

Refer to Page 5 in Service Manual when it is necessary to adjust the sealed component during servicing.
